

12. Given: Points $E(-4, 1)$, $F(2, 3)$, $G(4, 9)$, and $H(-2, 7)$
- Show that $EFGH$ is a rhombus.
 - Use slopes to verify that the diagonals are perpendicular.
13. Given: Points $R(-4, 5)$, $S(-1, 9)$, $T(7, 3)$ and $U(4, -1)$
- Show that $RSTU$ is a rectangle.
 - Use the distance formula to verify that the diagonals are congruent.
14. Given: Points $N(-1, -5)$, $O(0, 0)$, $P(3, 2)$, and $Q(8, 1)$
- Show that $NOPQ$ is an isosceles trapezoid.
 - Show that the diagonals are congruent.

Decide what special type of quadrilateral $HIJK$ is. Then prove that your answer is correct.

|-----------------|-------------|-------------|------------|
| 15. $H(0, 0)$ | $I(5, 0)$ | $J(7, 9)$ | $K(1, 9)$ |
| 16. $H(0, 1)$ | $I(2, -3)$ | $J(-2, -1)$ | $K(-4, 3)$ |
| 17. $H(7, 5)$ | $I(8, 3)$ | $J(0, -1)$ | $K(-1, 1)$ |
| 18. $H(-3, -3)$ | $I(-5, -6)$ | $J(4, -5)$ | $K(6, -2)$ |
19. Point $N(3, -4)$ lies on the circle $x^2 + y^2 = 25$. What is the slope of the line that is tangent to the circle at N ? (*Hint*: Recall Theorem 9-1.)
20. Point $P(6, 7)$ lies on the circle $(x + 2)^2 + (y - 1)^2 = 100$. What is the slope of the line that is tangent to the circle at P ?

In Chapter 3 parallel lines are defined as coplanar lines that do not intersect. It is also possible to define parallel lines *algebraically* as follows:

Lines a and b are *parallel* if and only if slope of a = slope of b (or both a and b are vertical).

21. Use the algebraic definition to classify each statement as true or false.
- For any line l in a plane, $l \parallel l$.
 - For any lines l and n in a plane, if $l \parallel n$, then $n \parallel l$.
 - For any lines k , l , and n in a plane, if $k \parallel l$ and $l \parallel n$, then $k \parallel n$.
22. Refer to Exercise 21. Is parallelism of lines an equivalence relation? (See Exercise 15, page 43.) Explain.

C 23. This exercise shows another way to prove Theorem 13-4.

- a. Use the Pythagorean Theorem to prove:

If $\overrightarrow{TU} \perp \overrightarrow{US}$, then the product of the slopes of \overrightarrow{TU} and \overrightarrow{US} equals -1 . That is, prove

$$\left(-\frac{c}{a}\right) \cdot \left(-\frac{c}{b}\right) = -1.$$

- b. Use the converse of the Pythagorean Theorem to prove:

If $\left(-\frac{c}{a}\right) \cdot \left(-\frac{c}{b}\right) = -1$, then $\overrightarrow{TU} \perp \overrightarrow{US}$.
