

Classroom Exercises

- Draw, if possible, a triangle in which the perpendicular bisectors of the sides intersect in a point with the location described.
 - A point inside the triangle
 - A point outside the triangle
 - A point on the triangle
- Repeat Exercise 1, but work with angle bisectors.
- Is there some kind of triangle such that the perpendicular bisector of each side is also an angle bisector, a median, and an altitude?
- $\triangle JAM$ is a right triangle.
 - Is \overline{JM} an altitude of $\triangle JAM$?
 - Name another altitude shown.
 - In what point do the three altitudes of $\triangle JAM$ meet?
 - Where do the perpendicular bisectors of the sides of $\triangle JAM$ meet?
 - Does your answer to (d) agree with Theorem 10-2?
- The medians of $\triangle DEF$ are shown. Find the lengths indicated.
 - $EP = \underline{\quad ? \quad}$
 - $PR = \underline{\quad ? \quad}$
 - If $FT = 9$, then $PT = \underline{\quad ? \quad}$ and $FP = \underline{\quad ? \quad}$.
- Given: \overline{RJ} and \overline{SK} are medians of $\triangle RST$;
 X and Y are the midpoints of \overline{RG} and \overline{SG} .
 - How are \overline{XY} and \overline{RS} related? Why?
 - How are \overline{KJ} and \overline{RS} related? Why?
 - How are \overline{KJ} and \overline{XY} related? Why?
 - What special kind of quadrilateral is $XYJK$? Why?
 - Why does $XG = GJ$?
 - Explain why $RG = \frac{2}{3}RJ$.

Written Exercises

- A** 1. Draw a triangle such that the lines containing the three altitudes intersect in a point with the location described.
- A point inside the triangle
 - A point outside the triangle
 - A point on the triangle

Exercises 2–5 refer to the diagram in which the medians of a triangle are shown.

- Find the values of x and y .
- If $AB = 6$, then $BP = \underline{\quad ? \quad}$ and $AP = \underline{\quad ? \quad}$.
- If $AB = 7$, then $BP = \underline{\quad ? \quad}$ and $AP = \underline{\quad ? \quad}$.
- If $PB = 1.9$, then $AP = \underline{\quad ? \quad}$ and $AB = \underline{\quad ? \quad}$.
