

7. a. Find the slope of \overleftrightarrow{AB} .
 b. Find $\tan n^\circ$.
 c. Consider the statement: If a line with positive slope makes an acute angle of n° with the x -axis, then the slope of the line is $\tan n^\circ$. Do you think this statement is true or false? Explain.

8. This exercise provides a geometric method of justifying the fact that you can use any two points on a line to determine the slope of the line. Horizontal and vertical segments have been drawn as shown. Supply the reason for each step.

Key steps of proof:

1. $\angle B \cong \angle A$
2. $\angle 1 \cong \angle 2$
3. $\triangle LBN \sim \triangle DAJ$
4. $\frac{BN}{AJ} = \frac{LB}{DA}$, or $\frac{BN}{LB} = \frac{AJ}{DA}$
5. The slope of \overline{LN} equals $\frac{BN}{LB}$, and
 the slope of \overline{DJ} equals $\frac{AJ}{DA}$.
6. Slope of $\overline{LN} = \text{slope of } \overline{DJ}$

Written Exercises

- A** 1. Name each line in the figure whose slope is:
 a. positive
 b. negative
 c. zero
 d. not defined
2. What can you say about the slope of (a) the x -axis? and (b) the y -axis?

Find the slope of the line through the points named. If the slope is not defined, write *not defined*.
