

45. The *arithmetic mean* between two numbers r and s is defined to be $\frac{r+s}{2}$.

- a. \overline{CM} is the median and \overline{CH} is the altitude to the hypotenuse of right $\triangle ABC$. Show that CM is the arithmetic mean between AH and BH , and that CH is the geometric mean between AH and BH . Then use the diagram to show that the arithmetic mean is greater than the geometric mean.
- b. Show algebraically that the arithmetic mean between two different numbers r and s is greater than the geometric mean. (*Hint:* The geometric mean is \sqrt{rs} . Work backward from $\frac{r+s}{2} > \sqrt{rs}$ to $(r-s)^2 > 0$ and then reverse the steps.)

8-2 The Pythagorean Theorem

One of the best known and most useful theorems in all of mathematics is the *Pythagorean Theorem*. It is believed that Pythagoras, a Greek mathematician and philosopher, proved this theorem about twenty-five hundred years ago. Many different proofs exist, including one by President Garfield (Exercise 32, page 438) and the proof suggested by the Challenge on page 294.

Theorem 8-2 Pythagorean Theorem

In a right triangle, the square of the hypotenuse is equal to the sum of the squares of the legs.

Given: $\triangle ABC$; $\angle ACB$ is a rt. \angle .

Prove: $c^2 = a^2 + b^2$

Proof:

Statements

Reasons

1. Draw a perpendicular from C to \overline{AB} .

1. Through a point outside a line, there is exactly one line \perp .

$$2. \frac{c}{a} = \frac{a}{e}; \frac{c}{b} = \frac{b}{d}$$

2. When the altitude is drawn to the hypotenuse of a rt. \triangle , each leg is the geometric mean between $\underline{\hspace{1cm}}$.

$$3. ce = a^2; cd = b^2$$

3. A property of proportions

$$4. ce + cd = a^2 + b^2$$

4. Addition Property of $=$

$$5. c(e + d) = a^2 + b^2$$

5. Distributive Property

$$6. c^2 = a^2 + b^2$$

6. Substitution Property
