

The proof of Theorem 8-1 is left as Exercise 40. The altitude to the hypotenuse divides the hypotenuse into two segments. Corollaries 1 and 2 of Theorem 8-1 deal with geometric means and the lengths of these segments.

For simplicity in stating these corollaries, the words *segment*, *side*, *leg*, and *hypotenuse* are used to refer to the *length* of a segment rather than the segment itself. We will use this convention throughout the book when the context makes this meaning clear.

Corollary 1

When the altitude is drawn to the hypotenuse of a right triangle, the length of the altitude is the geometric mean between the segments of the hypotenuse.

Given: $\triangle ABC$ with rt. $\angle ACB$; altitude \overline{CN}

Prove: $\frac{AN}{CN} = \frac{CN}{BN}$

Proof:

By Theorem 8-1, $\triangle ANC \sim \triangle CNB$. Because corresponding sides of similar triangles are in proportion, $\frac{AN}{CN} = \frac{CN}{BN}$.

Corollary 2

When the altitude is drawn to the hypotenuse of a right triangle, each leg is the geometric mean between the hypotenuse and the segment of the hypotenuse that is adjacent to that leg.

Given: $\triangle ABC$ with rt. $\angle ACB$; altitude \overline{CN}

Prove: (1) $\frac{AB}{AC} = \frac{AC}{AN}$ and (2) $\frac{AB}{BC} = \frac{BC}{BN}$

Proof of (1):

By Theorem 8-1, $\triangle ACB \sim \triangle ANC$. Because corresponding sides of similar triangles are in proportion, $\frac{AB}{AC} = \frac{AC}{AN}$. The proof of (2) is very similar.

Example 2 Use the diagram to find the values of h , a , and b .

Solution First determine what parts of the “big” triangle are labeled h , a , and b :

h is the altitude to the hypotenuse,
 a is a leg, and b is a leg.

By Corollary 1, $\frac{3}{h} = \frac{h}{7}$ and $h = \sqrt{21}$.

By Corollary 2, $\frac{10}{a} = \frac{a}{3}$ and $a = \sqrt{30}$.

By Corollary 2, $\frac{10}{b} = \frac{b}{7}$ and $b = \sqrt{70}$.
