

Exercises 18–20 deal with figures in space.

18. Given a sphere, what is the locus of the midpoints of the radii of the sphere?
19. Given a square, what is the locus of points equidistant from the sides?
20. Given a scalene triangle, what is the locus of points equidistant from the vertices?

- C** 21. A ladder leans against a house. As A moves up or down on the wall, B moves along the ground. What path is followed by midpoint M ? (*Hint: Experiment with a meter stick, a wall, and the floor.*)

22. Given a segment \overline{CD} , what is the locus in space of points P such that $m\angle CPD = 90^\circ$?

23. A goat is tied to a square shed as shown. Using the scale 1:100, carefully draw a diagram that shows the region over which the goat can graze.

24. A tight wire \overline{AC} is stretched between the tops of two vertical posts \overline{AB} and \overline{CD} that are 5 m apart and 2 m high. A ring, at one end of a 6 m leash, can slide along \overline{AC} . A dog is tied to the other end of the leash. Draw a diagram that shows the region over which the leashed dog can roam. Use the scale 1:100.

10-7 Locus Problems

The plural of *locus* is *loci*. The following problem involves intersections of loci.

Suppose you are given three noncollinear points, A , B , and C . In the plane of A , B , and C , what is the locus of points that are 1 cm from A and are, at the same time, equidistant from B and C ?

You can analyze one part of the problem at a time.

The locus of points 1 cm from A is $\odot A$ with radius 1 cm.

The locus of points equidistant from B and C is l , the perpendicular bisector of \overline{BC} .
