

**TABLE 4** Some Straight-Chain Alkyl Groups

Alkane	Name	Alkyl group	Name
CH <sub>4</sub>	methane	–CH <sub>3</sub>	methyl
CH <sub>3</sub> –CH <sub>3</sub>	ethane	–CH <sub>2</sub> –CH <sub>3</sub>	ethyl
CH <sub>3</sub> –CH <sub>2</sub> –CH <sub>3</sub>	propane	–CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>3</sub>	propyl
CH <sub>3</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>3</sub>	butane	–CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>3</sub>	butyl
CH <sub>3</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>3</sub>	pentane	–CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>2</sub> –CH <sub>3</sub>	pentyl

## Branched-Chain Alkane Nomenclature

The naming of branched-chain alkanes also follows a systematic method. The hydrocarbon branches of alkanes are alkyl groups. **Alkyl groups** are groups of atoms that are formed when one hydrogen atom is removed from an alkane molecule. Alkyl groups are named by replacing the suffix *-ane* of the parent alkane with the suffix *-yl*. Some examples are shown in **Table 4**. Alkyl group names are used when naming branched-chain alkanes. We will only present the method for naming simple branched-chain alkanes with only straight-chain alkyl groups. Consider the following molecule.

To name this molecule, locate the parent hydrocarbon. The parent hydrocarbon is the longest continuous chain that contains the most straight-chain branches. In this molecule, there are two chains that are eight carbon atoms long. The parent hydrocarbon is the chain that contains the most straight-chain branches. Do not be tricked by the way the molecule is drawn. The longest chain may be shown bent.
