- 1. Draw a large  $\bigcirc O$ . Choose a point A that is outside  $\bigcirc O$ . Construct the two tangents to  $\bigcirc O$  from point A.
- 2. Draw a very large obtuse triangle. Construct the inscribed circle.
- 3. Draw a segment about half as long as the width of your paper. Then divide the segment by construction into two segments whose lengths have the ratio 2:1.
- **4.** Draw a large  $\triangle ABC$ . Then construct  $\overline{DE}$  such that  $\frac{AB}{BC} = \frac{AC}{DF}$ .
- 5. Use  $\triangle ABC$  drawn in Exercise 4 to construct a segment,  $\overline{PQ}$ , whose length is the geometric mean of AB and AC.
- **6.** You are given  $\odot S$  and diameter FG. To construct parallel tangents to  $\odot S$ , you could construct a line that is  $\frac{?}{FG}$  at  $\frac{?}{FG}$  and a line that is  $\frac{?}{FG}$  to  $\overline{FG}$  at  $\frac{?}{}$ .
- 7. You are given  $\triangle TRI$ . Describe the steps you would use to circumscribe a circle about  $\triangle TRI$ .

## Locus

## **Objectives**

- 1. Describe the locus that satisfies a given condition.
- 2. Describe the locus that satisfies more than one given condition.
- 3. Apply the concept of locus in the solution of construction exercises.

## **10-6** The Meaning of Locus

A radar system is used to determine the position, or locus, of airplanes relative to an airport. In geometry locus means a figure that is the set of all points, and only those points. that satisfy one or more conditions.
