A solution of phosphoric acid contains H₃O⁺, H₃PO₄, H₂PO₄, HPO₄²⁻, and PO₄³. As with most polyprotic acids, the concentration of ions formed in the first ionization is the greatest. There are lesser concentrations of the respective ions from each succeeding ionization. Phosphoric acid is a weak acid in each step of its ionization.

Lewis Acids and Bases

The Arrhenius and Brønsted-Lowry definitions describe most acids and bases. Both definitions assume that the acid contains or produces hydrogen ions. A third acid classification, based on bonding and structure, includes, as acids, substances that do not contain hydrogen at all. This definition of acids was introduced in 1923 by G. N. Lewis, the American chemist whose name was given to electron-dot structures. Lewis's definition emphasizes the role of electron pairs in acid-base reactions. A Lewis acid is an atom, ion, or molecule that accepts an electron pair to form a covalent bond.

The Lewis definition is the broadest of the three acid definitions you have read about so far. It applies to any species that can accept an electron pair to form a covalent bond with another species. A bare proton (hydrogen ion) is a Lewis acid in reactions in which it forms a covalent bond, as shown below.

$$H^+(aq) + :NH_3(aq) \longrightarrow [H-NH_3]^+(aq) \text{ or } [NH_4]^+(aq)$$

The formula for a Lewis acid need not include hydrogen. Even a silver ion can be a Lewis acid, accepting electron pairs from ammonia to form covalent bonds.

$$Ag^+(aq) + 2:NH_3(aq) \longrightarrow [H_3N-Ag-NH_3]^+(aq) \text{ or } [Ag(NH_3)_2]^+$$

Any compound in which the central atom has three valence electrons and forms three covalent bonds can react as a Lewis acid. It does so by accepting a pair of electrons to form a fourth covalent bond, completing an electron octet. Boron trifluoride, for example, is an excellent Lewis acid. It forms a fourth covalent bond with many molecules and ions. Its reaction with a fluoride ion is shown below.

$$\begin{array}{c}
:\ddot{F}:\\ :\ddot{F}:\ddot{B} + :\ddot{F}:^{-} \longrightarrow \begin{bmatrix} :\ddot{F}:\\ :\ddot{F}:\ddot{B}:\ddot{F}: \end{bmatrix}^{-} \\ :\ddot{F}:\\ :\ddot{F}:\end{bmatrix}$$

$$BF_{3}(aq) + F^{-}(aq) \longrightarrow BF_{4}(aq)$$
