Chapter Summary

- 1. A parallelogram has these properties:
 - a. Opposite sides are parallel.
 - b. Opposite sides are congruent.
 - c. Opposite angles are congruent.
 - d. Diagonals bisect each other.
- 2. The chart on page 172 lists five ways to prove that a quadrilateral is a parallelogram.
- 3. If two lines are parallel, then all points on one line are equidistant from the other line.
- 4. If three parallel lines cut off congruent segments on one transversal, then they cut off congruent segments on every transversal.
- 5. A line that contains the midpoint of one side of a triangle and is parallel to another side bisects the third side.
- 6. The segment that joins the midpoints of two sides of a triangle is parallel to the third side and has a length equal to half the length of the third side.
- 7. The midpoint of the hypotenuse of a right triangle is equidistant from all three vertices.
- 8. Rectangles, rhombuses, and squares are parallelograms with additional properties. Trapezoids and kites are not parallelograms, but are special quadrilaterals with additional properties.
- 9. The median of a trapezoid is parallel to the bases and has a length equal to half the sum of the lengths of the bases.

Chapter Review

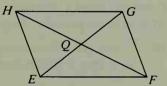

In parallelogram EFGH, $m \angle EFG = 70$.

2. If
$$m \angle EFH = 32$$
, then $m \angle EHF = \frac{?}{}$.

3. If HQ = 14, then $HF = \frac{?}{}$.

4. If
$$EH = 8x - 7$$
 and $FG = 5x + 11$, then $x = \frac{?}{}$.

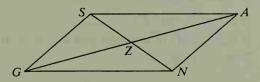

In each exercise you could prove that quad. SANG is a parallelogram if one more fact, in addition to those stated, were given. State that fact.

5.
$$GN = 9$$
; $NA = 5$; $SA = 9$

6. $\angle ASG \cong \angle GNA$

7. $\overline{SZ} \cong \overline{NZ}$

8. $\overline{SA} \parallel \overline{GN}$; SA = 17
